ABOUT R S MECH TECH

Your Trusted Custom Fabrication Partner

At R S Mech Tech, we take pride in being a leading force in the world of custom fabrication. Since our establishment in 2013, we have been unwavering in our commitment to delivering top-notch fabrication solutions to a diverse range of industries. As an ISO Certified Manufacturer and Supplier, we bring innovation, precision, and excellence to every project we undertake.

Our Expertise

Our journey in the field of fabrication has been fueled by a team of highly skilled and dedicated professionals. With years of hands-on experience, our experts bring a wealth of knowledge to the table, enabling us to turn your ideas into reality. From concept to creation, we meticulously plan, design, and execute fabrication projects tailored to your specific needs.

Cutting-Edge Technology

Embracing the latest advancements in fabrication technology, we ensure that every product we craft meets the highest standards of quality and durability. Our state-of-the-art facilities house advanced machinery and equipment, allowing us to take on projects of varying complexities and sizes with ease.

Comprehensive Solutions

R S Mech Tech offers a comprehensive range of fabrication services, catering to a multitude of industries including Infra, Construction, Power, Pipeline, Refinery, Metro, and Rail Projects. Whether you need precision-cut components, structural assemblies, or intricate designs, we have the expertise to deliver exceptional results.

Commitment to Quality

Quality isn't just a buzzword for us; it's the cornerstone of our business philosophy. We adhere to rigorous quality control measures throughout every stage of the fabrication process, ensuring that the end product not only meets but exceeds your expectations. Our ISO certification is a testament to our unwavering dedication to delivering excellence.

Client-Centric Approach

At R S Mech Tech, we understand that each client is unique, and their requirements are distinct. That's why we take a client-centric approach, working closely with you to understand your vision, requirements, and goals. Your satisfaction is our priority, and we go the extra mile to ensure that the final product aligns seamlessly with your vision.

Join Hands with R S Mech Tech

When you partner with R S Mech Tech, you're not just getting a fabrication service – you're gaining a collaborative partner dedicated to bringing your ideas to life. With our expertise, technology, and commitment to quality, we are poised to take your projects to new heights of success.

Contact us today

Contact us today to discuss your fabrication needs and embark on a journey of innovation and excellence with R S Mech Tech.

Feel free to modify and personalize this content to best reflect the unique identity and values of R S Mech Tech's fabrication services.

15 DP Tie Rod

FABRICATION

FABRICATION

SPECIALISED CUSTOMISED FABRICATION WORK AS PER REQUIREMENT

Customized fabrication is a dynamic and innovative manufacturing process that caters to the unique needs and preferences of individual customers. It involves creating tailor-made products or components that are specifically designed to meet precise specifications and requirements. Through a combination of advanced technologies, skilled craftsmanship, and a deep understanding of customer needs, customized fabrication enables the production of one-of-a-kind items that may not be available as standard off-the-shelf products. This process empowers customers to bring their ideas to life, providing them with unparalleled flexibility, personalization, and control over the final product. From custom-designed furniture and personalized jewelry to specialized machinery and architectural structures, customized fabrication offers limitless possibilities for creativity and individual expression.

Maintenance Gallery & Inspection Ladder (Also Provide on Site Erection Work)

A maintenance gallery, also known as an access gallery or maintenance platform, is a raised platform or walkway designed to provide safe access for maintenance and inspection activities on pillars or other vertical structures with a height of more than 10 meters (approximately 33 feet). It allows workers to reach elevated areas and perform necessary tasks while ensuring their safety.

By providing a safe and stable working environment at heights greater than 10 meters, a maintenance gallery allows for efficient and effective maintenance and inspection of pillars or other vertical structures. It helps to mitigate the risks associated with working at elevated heights and ensures the safety of workers throughout the maintenance process.

FABRICATION

Evacuation Barrier

An evacuation barrier is a safety measure designed to control and guide the movement of people during emergency evacuations. It is used to create a clear and safe pathway for evacuees to exit a building or area in the event of a fire, natural disaster, or any other emergency situation.

Water Stopper Plate

A water stopper plate, also known as a water stop plate or water stopper barrier, is a device used in construction to prevent the passage of water through joints or gaps in concrete structures. It is designed to create a watertight seal and ensure the integrity of water containment in areas such as basements, underground structures, or water-retaining structures.

It's important to consult with professionals or specialists in waterproofing and construction to determine the appropriate type of water stopper plate and installation method based on the specific project requirements and conditions.

FABRICATION

Cover Plates

Cover plate refers to a component used to cover and protect the water stopper from external elements. While water stoppers themselves are typically installed within joints or gaps in concrete structures to prevent water penetration, cover plates are used to provide additional protection and maintain the integrity of the water stopper.

Regular inspection and maintenance of the cover plates, as well as the water stopper itself, are crucial to ensure they remain in good condition and continue to effectively prevent water leakage or penetration.

Drainage Spouts

A drainage spout, also known as a drain spout or downspout, is a component of a building's rainwater drainage system. It is typically attached to the gutter system and is responsible for directing rainwater from the roof and gutters away from the building's foundation.

Properly installed and maintained drainage spouts play a crucial role in protecting buildings from water damage by effectively managing rainwater runoff. They help prevent erosion, foundation damage, basement flooding, and other moisture-related issues. It is important to ensure that the spouts are correctly positioned, adequately sloped, and free from any obstructions to ensure efficient drainage.

FABRICATION

Shaft Climbing Pawl & Pocket

A shaft climbing pawl and pocket are components of a climbing system used for vertical access and movement in tall structures such as chimneys, towers, or shafts. These components are commonly used in construction, maintenance, and inspection activities where workers need to ascend or descend within confined vertical spaces.

Shaft Climbing Pawl: The shaft climbing pawl, also known as a climbing device or pawl mechanism, is a mechanical device that securely attaches to a vertical shaft or structure. It is designed to provide a means of controlled movement and prevent unintentional slipping or falling during ascent or descent. The pawl typically features teeth or gripping elements that engage with the shaft, allowing the user to climb or descend step by step.

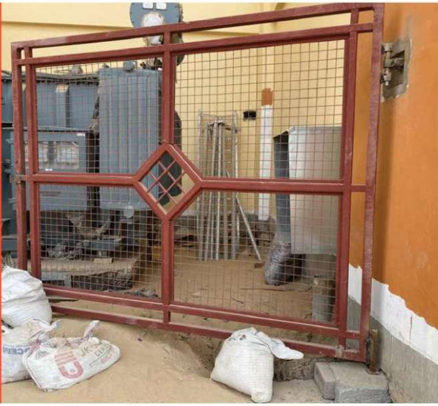
Pocket: A pocket, also referred to as a pawl pocket or climbing pocket, is a recessed area or housing located within the shaft or structure. The pocket is specifically designed to accommodate the shaft climbing pawl. It provides a secure location for the pawl to engage or disengage with the shaft, ensuring stable and controlled movement for the user.

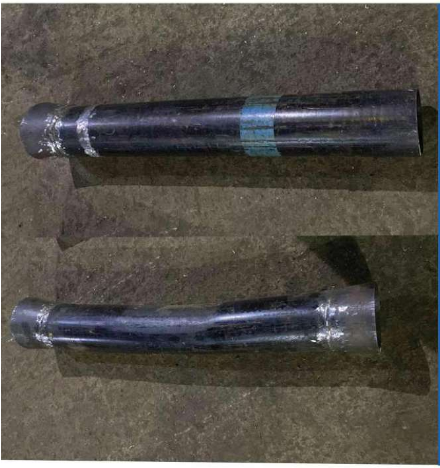
FABRICATION

Transformer Gate

MS Transformer Gate" refer to a gate entry point or access control system used to monitor and regulate the entry of labor, materials, machinery, equipment, and cranes into a construction site.

The gate system can contribute to site safety by enforcing safety protocols, ensuring only trained and qualified personnel and equipment enter the construction site. It can also monitor compliance with safety regulations and manage the flow of vehicles and equipment to prevent congestion or accidents.





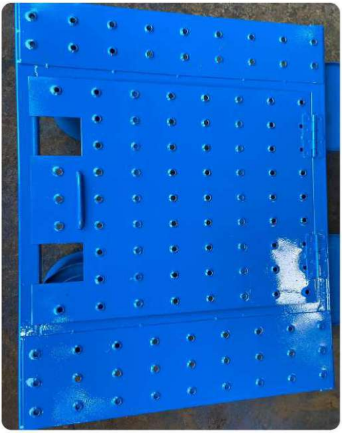
Deviation Pipe

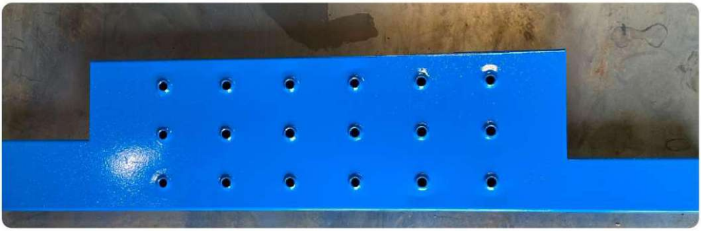
Deviation and expansion steel pipes are often used in the construction of bridge spans over rivers or other bodies of water. These specialized pipes are designed to accommodate movements caused by thermal expansion, contraction, and structural deflections.

Deviation and expansion steel pipes play a critical role in ensuring the structural integrity and safety of bridge spans over rivers. They allow for controlled movement and help to prevent damage or failure of the bridge structure due to temperature variations and other environmental factors. Proper installation and maintenance of deviation and expansion steel pipes are necessary to ensure their continued effectiveness and longevity.

Climbing formwork systems, a safety screen refers to a protective barrier or enclosure that is installed on the exterior face of the climbing formwork during construction activities. It provides a safe working environment for workers involved in vertical construction and helps prevent falls or accidents.

PB WALKWAY FOR SAFETY SCREEN





FABRICATION

Mobile Foam work Tower

A mobile foamwork tower, also known as a mobile scaffold tower or mobile access tower, is a versatile and portable structure used in construction, maintenance, and repair projects. It provides a safe working platform for workers to access elevated areas, perform tasks, and carry out various construction activities.

It also used for Survellaince.

FABRICATION

Puddle Flange

A puddle flange is a plumbing fitting used in construction and infrastructure projects to prevent water penetration around pipes that pass through concrete structures, such as floors, walls, or foundations. It is designed to create a waterproof seal and protect against the potential ingress of water or other liquids.

By incorporating puddle flanges into construction projects, the risk of water damage, moisture intrusion, and potential structural issues caused by water penetration can be significantly reduced. They help maintain the integrity of concrete structures and protect against water-related problems such as dampness, mold growth, and deterioration.

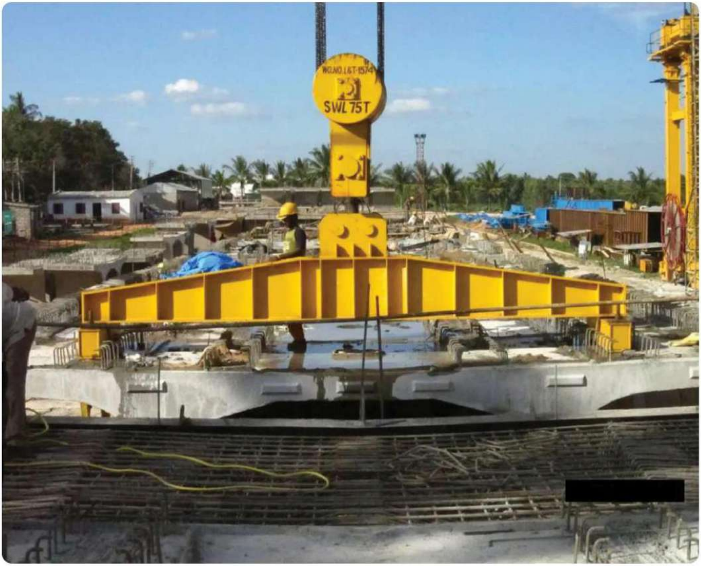
FABRICATION

STRUCTURE FABRICATION & HEAVY ENGINEERING

Segment Lifting Beam

A segment lifting beam, also known as a spreader beam or lifting beam, is a specialized device used in the construction and industrial sectors to lift and transport heavy or bulky loads. It is designed to provide a stable and secure lifting solution by evenly distributing the load's weight across multiple lifting points.

Segment lifting beams typically consist of a long, rigid beam with multiple attachment points along its length. The attachment points, often equipped with shackles or hooks, are used to connect the lifting beam to a crane or other lifting equipment. The beam's length is determined by the span required to accommodate the load being lifted.

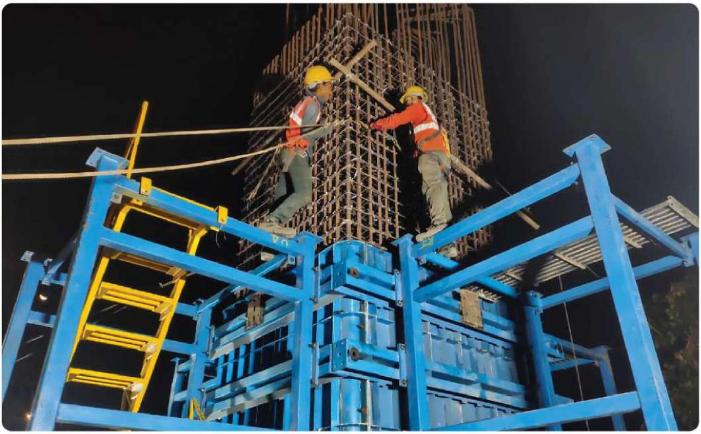


[redacted]

FABRICATION

Pile Cap Shutters

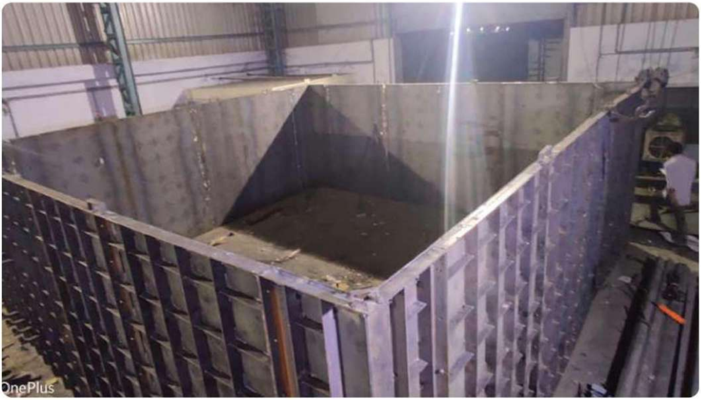
A pile cap shutter, as mentioned earlier, is a temporary formwork system used during the construction of pile caps. Pile caps are thick concrete mats that are placed on top of groups of piles to distribute the load from columns or walls to the piles below. The pile cap shutter is assembled around the pile heads to contain the poured concrete and shape it into the desired form. It also supports the reinforcing steel bars (rebar) within the pile cap. Once the concrete has cured and gained sufficient strength, the shutter is removed.



FABRICATION

Pier Cap Shutter

A pier cap shutter serves a similar purpose as a pile cap shutter but is specifically designed for constructing pier caps. Pier caps are horizontal structural elements that sit on top of bridge piers or columns to support the bridge deck or beams. Pier caps transfer the load from the bridge or structure to the supporting piers. The pier cap shutter is assembled around the pier head, creating a mold for pouring and shaping the concrete. It provides support and containment for the poured concrete and ensures that the reinforcing steel bars are properly positioned. Once the concrete has cured, the shutter is dismantled or removed, leaving behind a solid pier cap.



FABRICATION

Liner

MS liners are often used to line the interior of structures such as tanks, pipes, or ducts to protect them from corrosion, abrasion, or chemical attack. The MS liner acts as a protective barrier, extending the lifespan of the structure and ensuring its integrity.

PLANT & EQUIPMENT FABRICATION WORK

Insert Plates

An insert plate, also known as a router plate or router table plate, is a flat, removable plate designed to fit into the top surface of a router table. It provides a stable and convenient platform for mounting a handheld router upside down, allowing for precise and controlled routing operations.

Some insert plates may have additional features such as leveling screws for fine-tuning the plate's height, built-in router lifts for convenient bit adjustments from above the table, or insert rings to accommodate various router bit diameters.

FABRICATION

LIGHT WEIGHT FABRICATION

Man Basket Cage

Man basket cages provide a safe and efficient means for workers to access elevated areas and perform tasks at height. They are commonly used in construction, maintenance, and industrial settings, such as in power plants, refineries, bridge construction, or building exteriors.

It is crucial to follow safety guidelines, conduct proper training for operators and workers, and regularly inspect the man basket cage and its suspension system to ensure safe usage and prevent accidents.

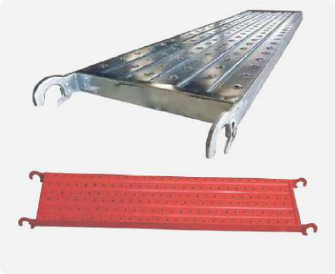
APH CRANES
SWL
500Kg

MS Roller

Conveyor Rollers: Conveyor rollers are used in conveyor systems to support and guide the movement of objects or materials along a belt. They are often made of materials such as steel, plastic, or rubber and can be designed with various surface patterns to enhance grip and facilitate smooth transportation.

Support rollers are used to support and guide heavy loads or equipment. They are commonly found in machinery like cranes, forklifts, or conveyors, where they bear the weight and enable smooth movement.

SCAFFOLDING

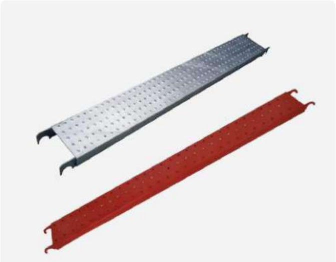


WALKWAY PLANKS (AUTO LOCK HOOK)

Walkway planks, also known as walkway gratings or walkway platforms, are flat, sturdy surfaces designed for safe pedestrian passage over open or elevated areas. They are commonly used in industrial, commercial, and construction settings to create temporary or permanent walkways, access paths, or elevated platforms.

WALKWAY PLANKS (FIX HOOK)

When using walkway planks, it is essential to follow safety guidelines and regulations, such as those set by Occupational Safety and Health Administration (OSHA) or relevant local authorities. Regular inspection, maintenance, and cleaning are important to ensure the integrity and safety of the walkway planks.



WALKWAY PLANK (WITHOUT HOOK)

Walkway planks offer a practical solution for creating safe pedestrian walkways in various industrial and commercial environments. They enhance accessibility, improve worker safety, and facilitate movement over open or elevated areas.

SCAFFOLDING

DIAMOND GRIP WALKWAYS

SCAFFOLDING

ADJSUTABLE STEEL PROP

Form work Bracing: Adjustable steel props are often used to brace formwork systems during concrete pouring. They provide lateral support to the formwork, preventing it from shifting or collapsing under the weight of the wet concrete. The props are typically placed at regular intervals along the formwork to ensure stability during the pouring and curing process.

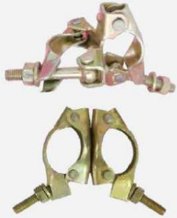
CONNECTING SLEEVE

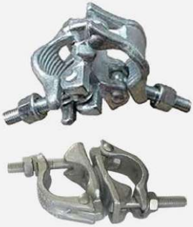


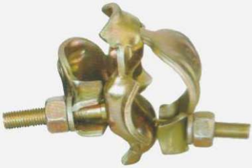
PRESSED FIX /SWIVEL COUPLER

Pressed fix/swivel coupler is a type of scaffolding coupler that is used to connect two scaffold tubes at any angle. It is used to join two tubes together at right angles and is commonly used in scaffolding applications.

FORGED FIX/SWIVEL COUPLER

The forged fix/swivel coupler is designed to fit over the end of two scaffold tubes and is then tightened using a bolt and nut. The swivel coupler allows for greater flexibility in the positioning of the scaffold tubes.



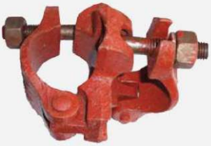


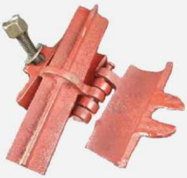
U-SHAPED ADJUSTABLE BASE COUPLER

SLEEVE COUPLER

A sleeve coupler is a type of coupling used in construction and scaffolding applications to connect two scaffold tubes end-to-end. It consists of a cylindrical sleeve with internal grooves or ridges and a set of bolts or pins that secure the tubes together.

RIGHT ANGLE COUPLER





CONNECTING COUPLER

W-SHAPED CLAMP

JOINTING PIN

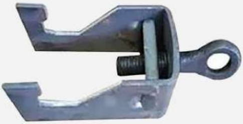
Joint pin is a type of scaffolding accessory that is used to connect two scaffold tubes end to end. It is used to create a longer scaffold tube and is commonly used in scaffolding applications.

PUTLOG COUPLER

WALLER PLATE

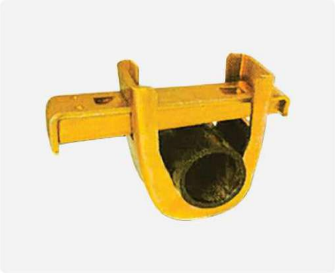
The waller plate is typically a flat, rectangular or square plate made of steel or another strong material. It is installed at the junction where two or more structural members meet, such as where a beam intersects a column or where two beams are connected.

SINGLE CLAMP



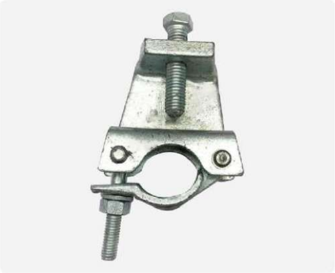
WEDGE PIN

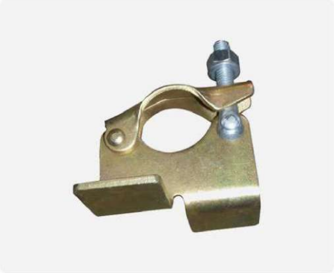
Wedge pin is a type of scaffolding accessory that is used to secure the scaffold tube to the scaffold fitting. It is used to prevent the tube from slipping or moving and is commonly used in scaffolding applications.



SINGLE WEDGE COUPLER SCAFOLDING

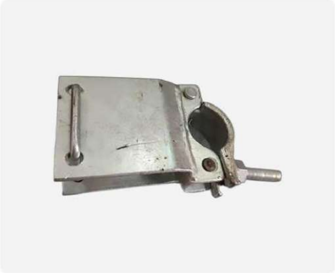
BEAM GIRDER COUPLER





BRC CLAMP

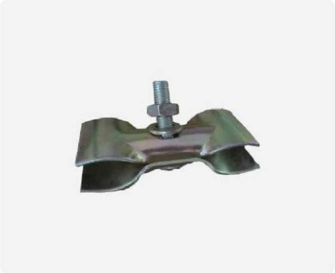
SCAFFOLDING



LADDER CLAMP

Ladder clamp is a type of scaffolding clamp that is used to attach a ladder to a scaffold. It is used to secure the ladder to the scaffold and prevent it from slipping or moving.

FENCE COUPLER



SCAFFOLDING PIPES

Scaffolding pipes are designed to provide stability and support for workers, tools, and materials at elevated heights during building construction, maintenance, repair, or renovation projects. They are an integral part of scaffolding systems, forming the framework upon which the scaffolding structure is built.

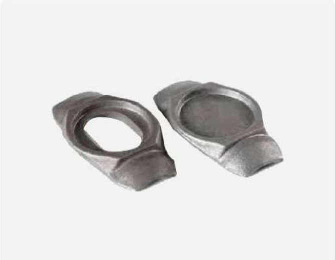
SCAFFOLDING

TURN BUCKLE

The primary function of a turnbuckle is to provide a means of tightening or loosening the tension in a system by adjusting the length of the connected components. This is achieved by rotating the central threaded section of the turnbuckle, which simultaneously moves the two end fittings closer together or farther apart.

BASE PALTE

A base plate, also known as a foundation plate or mounting plate, is a flat, usually square or rectangular, metal or plastic plate that serves as a support or anchor for various structures, equipment, or objects. It is typically installed at the base or bottom of the object it is supporting.



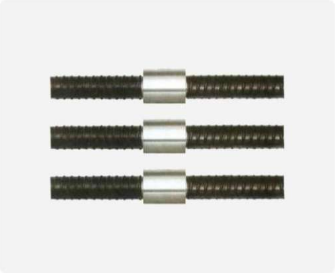
LEDGER BLADE

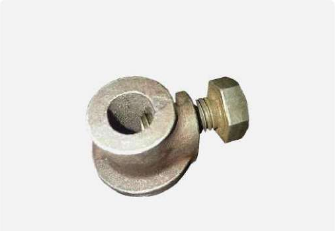
SCAFFOLDING

FORGED HALF COUPLER

The forged half coupler is made through a process called forging, where a solid piece of metal is heated and shaped using extreme pressure. This forging technique ensures that the coupler has high strength and durability, making it suitable for heavy-duty applications.

BAR SPLICE COUPLER





GOGO CLAMP

SCAFFOLDING

ANCHOR NUT

An anchor nut is a type of nut that is used to create a permanent and secure connection between two components, usually on the blind side or the backside of an assembly. An anchor nut is internally threaded and can be attached to a bolt or a screw that passes through the assembly.

WING NUT

A wing nut is a type of nut that has two wings or projections on either side that can be gripped and turned by hand. A wing nut can be used to fasten or adjust two or more components without the need for a tool. A wing nut can have different shapes and sizes, depending on the application and the requirement.

TIE ROD

A tie rod is a type of rod or bar that is used to connect or hold two or more components together, usually under tension. A tie rod can have different shapes and sizes, depending on the application and the requirement.

SCAFFOLDING

ANCHOR CONE

An anchor cone is a device that is used to anchor the end of a prestressing strand or cable within a concrete structure. An anchor cone is typically made of cast iron or steel and is inserted into a drilled hole in the concrete. An anchor cone has a conical shape that allows the strand or cable to flare out and create a strong bond with the concrete.

WATER STOPPER

A water stopper is a device that is used to prevent or reduce the leakage of water through joints or cracks in concrete structures, such as basements, tanks, pools, foundations, etc. A water stopper can be made of plastic or rubber, and can have different shapes and sizes, depending on the application and the requirement

CEREMIC FERRULE

A ceramic ferrule is used to hold and align the fiber optic cable within a connector. A ceramic ferrule can provide a precise and stable connection that minimizes the loss of light and improves the transmission quality.

SCAFFOLDING

SCAFFOLDING HOLDER AND TAGS

A scaffolding holder and tag is a device that is used to display and record the safety information and status of a scaffolding structure. A scaffolding holder and tag consists of a plastic or metal holder that can be attached to the scaffolding frame, and a paper or plastic tag that can be inserted into the holder.

PVC COVER BLOCK

A PVC cover block is a device that is made of polyvinyl chloride (PVC) material and is used to provide a minimum cover or gap between the reinforcement bars and the concrete surface. A PVC cover block can help to protect the reinforcement bars from corrosion, fire, and mechanical damage, and also ensure the structural strength and durability of the concrete.

PVC RUNGS

A PVC rung is a device that is made of polyvinyl chloride (PVC) material and is used to provide a step or a foothold for climbing or descending a structure, such as a water tank, a sewerage manhole, or an overhead tank.

SCAFFOLDING

REBAR CAP

A rebar cap is a protective cover for the end of a concrete reinforcing bar that is placed on protruding rebar at construction sites.

T BOLT

A T bolt is a type of fastener characterized by its T-shaped head and threaded shaft. It is commonly used in mechanical and structural applications where a secure and adjustable connection is required.

EYE BOLT

An eye bolt is a type of fastener commonly used in construction, rigging, and lifting applications. It consists of a threaded shank with a looped eye at one end, resembling a bolt with a circular or oval-shaped attachment point.

SCAFFOLDING

STUB PIN

A stub pin is a small, sturdy metal pin used in construction and scaffolding to secure and align scaffolding components. It is commonly used in conjunction with couplers or connectors to create a stable and secure scaffolding structure.

CROW BAR

Crow bars come in various sizes, with lengths ranging from a few inches to several feet. They are typically made from strong and durable materials like steel, ensuring their ability to with stand high levels of force. Some crowbars may also feature additional features like a textured grip or a flat striking surface on the hooked end for added functionality.

ACROW PLATE

Acrow plate is a type of scaffolding accessory that is used to secure the scaffold tube to the scaffold fitting. It is used to prevent the tube from slipping or moving and is commonly used in scaffolding applications.

ACROW SPAN

Acrow span is a type of scaffolding accessory that is used to create a longer scaffold tube. It is used to connect two scaffold tubes end to end and is commonly used in scaffolding applications.

C CLAMP

The C clamp gets its name from its shape, resembling the letter "C". It consists of a screw mechanism and a fixed jaw or pad on one side, and a sliding jaw or pad on the other side. The fixed jaw is typically attached to a stationary surface or workbench, while the sliding jaw can be adjusted along the screw to accommodate

different object sizes.

CABLE TRAY

A cable tray is a structure used to support and organize electrical cables and wires in various commercial, industrial, and residential settings. It is designed to provide a safe and efficient solution for cable management, allowing for easy installation, maintenance, and accessibility.

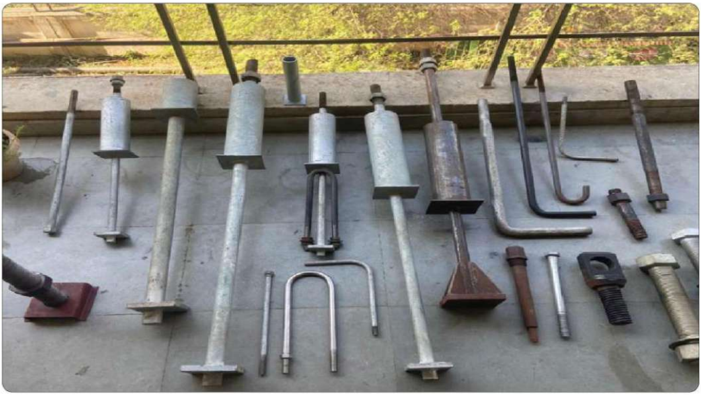
ALL TYPE OF BOLTS MANUFACTURED

We are delighted to introduce R S MECH TECH, As a leading manufacturer specializing in the production of all types of bolts, catering to a diverse range of industries and applications. With an unwavering commitment to quality, precision, and customer satisfaction, we have established ourselves as a trusted name in the manufacturing of foundation bolts, anchor bolts, tensile bolts, mast bolts, and more, all available in various grades, including 4.6, 8.8, 10.9, and beyond.

At R S MECH TECH, we take pride in our state-of-the-art manufacturing facility, equipped with advanced machinery and operated by a highly skilled team of engineers and technicians. We employ cutting-edge technology and adhere to stringent quality control measures at every step of the manufacturing process to ensure that our bolts meet and exceed industry standards.

Whether you require foundation bolts for construction projects, anchor bolts for securing structures, tensile bolts for heavy-duty applications, or mast bolts for telecommunications installations, we have the expertise and capability to provide the perfect solution for your needs. Our extensive product range caters to a wide array of specifications and customization requirements.

We believe in delivering products that perfectly align with our clients' unique requirements. Whether it's a specific size, coating, threading, or any other custom specification, our team is dedicated to working closely with you to provide tailor-made solutions that meet your project's exacting needs.

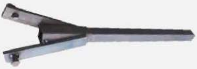


WALL TIE

Wall ties are hidden from view after construction, but they play a vital role in ensuring the stability of the building. Wall ties are usually made of corrosion-resistant and fire-resistant materials, such as stainless steel or basalt fibres, and have a drip formation to prevent water from crossing the cavity between the walls.

SACRIFICIAL WALL TIE

A sacrificial wall tie is a type of wall tie that is designed to be left in place after the removal of formwork in concrete construction. Sacrificial wall ties are usually made of mild steel and have a break-off point that allows the outer part of the tie to be snapped off, leaving the inner part embedded in the concrete.



PANNEL PULLAR

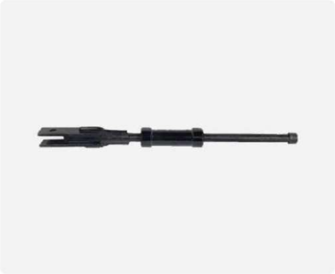
A panel puller is a tool that is used to remove or install panels, such as formwork panels, door panels, wall panels, etc. Panel pullers can have different shapes and sizes, depending on the type and size of the panel they are designed for.

HOLE BARI

A hole bari consists of a metal rod with a pointed tip that can pierce through the material and a handle that can be gripped or hammered to apply force on the rod. A hole bari can have different lengths and diameters, depending on the size and depth of the hole required.

WALL TIE REMOVER

A wall tie remover is a tool that is used to remove the wall ties that are used to connect two parallel walls of a building, usually made of bricks or blocks. Wall ties are hidden from view after construction, but they may need to be removed for various reasons, such as repairing, replacing, or inspecting the walls.



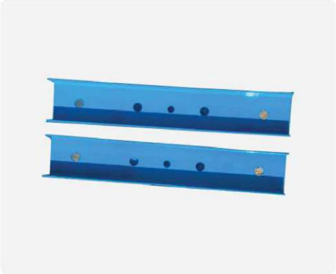
HDPE SLEEVE

An HDPE sleeve is a cylindrical tube that is made of high-density polyethylene (HDPE), a type of plastic that is resistant to corrosion, abrasion, impact, and chemicals. An HDPE sleeve can be used for various purposes.

HDPE SLEEVE EJECTOR

An ejector sleeve is a cylindrical part that is used in injection molding machines to eject the plastic parts from the mold. The sleeve is placed in the mold and is used to push the part out of the mold when it is opened.

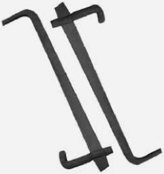
H-BEAM SPLICE



VERTICAL SOLDIER

A vertical soldier can be installed by boring holes on the wall line, typically at 2 to 3m centers, placing the steel beams or columns within the holes and concreting the base of each beam or column below the final formation level.

FOAM WORK



SIKANJA CLAMP

A sikanja clamp is a type of hardware that is used to support scaffolding structures or column shuttering at construction sites. A sikanja clamp consists of a metal rod with a C-shaped hook at one end and a threaded end at the other. The hook can grip the edge of a shuttering plate or a scaffolding pipe, while the threaded end can be tightened or loosened by a nut to adjust the clamping force.

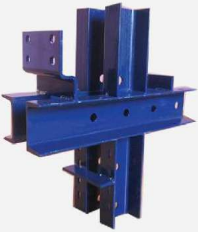
TRIPOD

A tripod is a device that consists of three legs and a platform or a head that can support and stabilize another object, such as a camera, a telescope, a lamp, etc. A tripod can have different features and functions, depending on the type and purpose of the object it supports.

BOTTOM ALLIGMENT TURN BUCKLE

A bottom alignment turnbuckle is a type of turnbuckle that is used to adjust the alignment of the bottom rails or plates of a formwork system. A turnbuckle is a device that consists of a metal body with two threaded end fittings that can be screwed in or out to increase or decrease the tension or length of a rigging assembly.

FOAM WORK



UNIVERSAL INSIDE CORNER

BEAM FORMING SUPPORT

A beam forming support is a device that is used to support and align the beams or girders that are used to form the shape and size of a concrete structure, such as a bridge, a building, or a tunnel. A beam forming support consists of a metal frame with adjustable legs and clamps that can hold the beams or girders in place during the construction process.
